# Between Path-Consistency and Higher Order Consistencies in Boolean Satisfiability

#### **Pavel Surynek**

Department of Theoretical Computer Science and Mathematical Logic Faculty of Mathematics and Physics Charles University in Prague

http://ktiml.mff.cuni.cz/~surynek

# **Constraint Satisfaction Problem (CSP)**

- Constraint satisfaction problem over the universe of elements D is a triple (X,C,D)
  - X finite set of variables
  - C finite set of constraints
  - $\mathbf{D}$  is a function D:X  $\rightarrow \mathcal{P}(\mathbb{D})$
  - each constraint  $c \in C$  is a construct of the form <( $x_1^c, x_2^c, ..., x_{k(c)}^c$ ),  $R^c$ >
    - k(c) is arity of the constraint
    - $x_i^c \in X$  for I = 1,2,...,k(c) and  $R^c \subseteq D(x_1^c) \times D(x_2^c) \times ... \times D(x_{k(c)}^c)$
- The task is to find assignment of values to variables from their domains such that all the constraints are satisfied
  - or decide that no such valuation exists
- Decision variant is an NP-complete problem

example: a=1, b=2, c=2

Pavel Surynek, 2011

example:  $\mathbb{D} = \{1,2,3\}$   $X = \{a,b,c\}$   $C = \{\langle (a,b), '' < " >;$   $\langle (b,c), '' = " > \}$  $D(a) = D(b) = D(c) = \mathbb{D}$ 

# **Boolean Satisfiability (SAT)**

 A Boolean formula is given - variables can take either the value TRUE or FALSE

example:  $(\neg x \Rightarrow \neg y) \land (x \Rightarrow \neg y)$ 

- The task is to find valuation of variables such that the formula is satisfied
  example: x = TRUE
  - or decide that no such valuation exists
- Conjunctive normal form (CNF) standard form of the input formula for SAT solvers
  - **variables**: x<sub>1</sub>,x<sub>2</sub>,x<sub>3</sub>,...
  - **literals**:  $x_1, \neg x_1, x_2, \neg x_2, \dots$  variable or its negation
  - **clauses**:  $(x_1 \lor \neg x_2 \lor \neg x_3)$  ... disjunction of literals
  - **formula**:  $(x_1 \lor \neg x_2) \land (x_1 \lor x_2 \lor \neg x_3)$  ... conjunction of clauses
- Clauses represent constraints that must be all satisfied (can be regarded as CSP) – SAT and CSP are mutually reducible

y = FALSE

# **Motivation for Global Consistencies**

- CSP paradigm provides many types of local consistencies
  - Iocal inference is typically too weak for SAT
  - arc-consistency, path-consistency, i,j-consistency
    - insignificant gain in comparison with unit-propagation
    - expensive propagation with respect to the inference strength
- Global consistencies (global constraints)
  - provide strong global inference
    - often leads to significant simplification of the problem
  - application of global consistencies in SAT is quite rare
- Consistency based on structural properties
  - interpret SAT as a graph and find graph structures

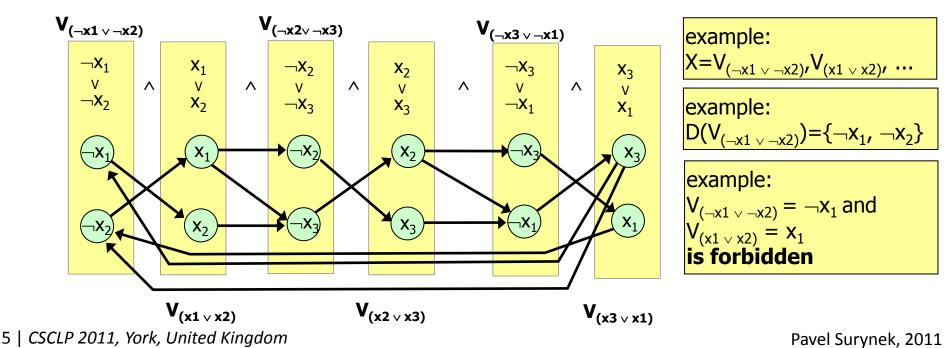

4 | CSCLP 2011, York, United Kingdom

Pavel Surynek, 2011

# Path-consistency in Literal Encoding (1)

#### • SAT as CSP: Literal encoding model (X,C,D)

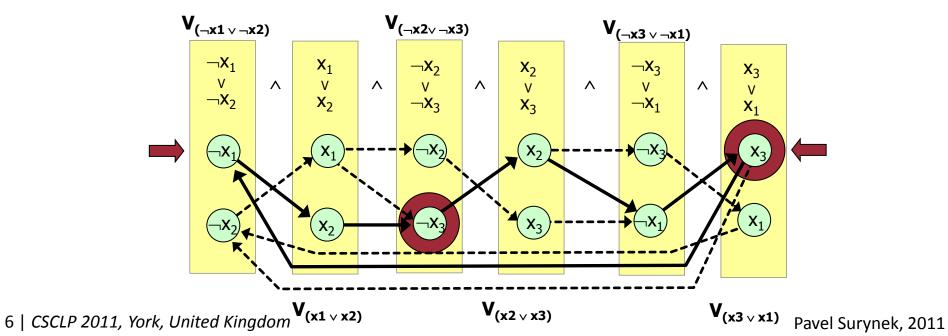

- X ... variables ↔ clauses, C ... constraints ↔ values standing for complementary literals are forbidden, D ... variable domains ↔ literals
- Interpret path-consistency in the CSP model of SAT as a directed graph
  - **vertices**  $\leftrightarrow$  values in domains, **edges**  $\leftrightarrow$  allowed pairs of values

# Path-consistency in Literal Encoding (2)

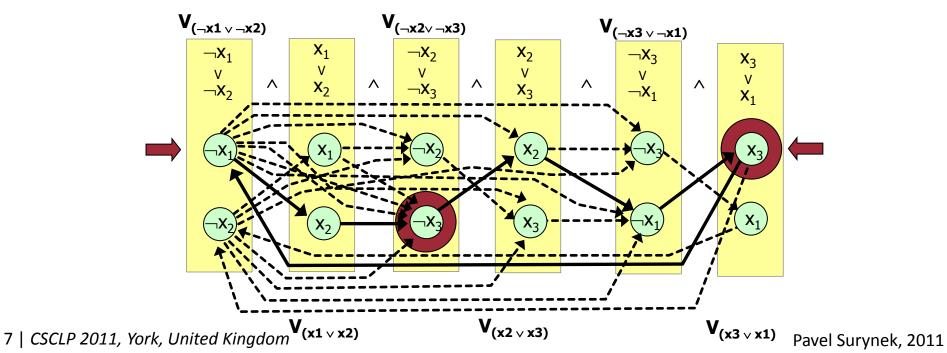

#### • Let us have a sequence of variables (path)

- a pair of values is **path-consistent** w.r.t. to the sequence if there is an oriented path connecting them in the graph interpretation going through the sequence and values itself are connected
- Ignores constraints between non-neighboring variables in the sequence of variables

# (2,k)-consistency in Literal Encoding

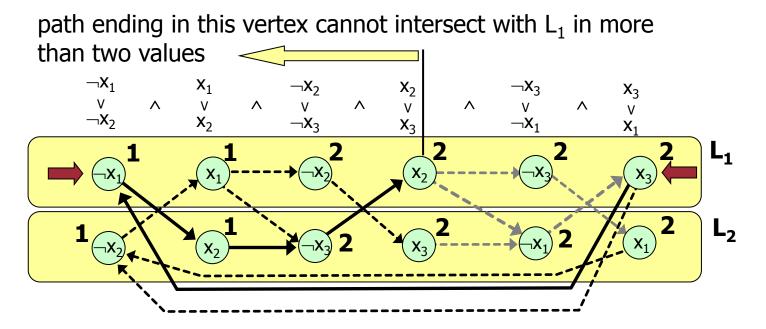

- Sequence of variables (path) of the length k+2
  - a pair of values is (2,k)-consistent w.r.t. to the sequence if there is a consistent supporting k-tuple of values in the domains of other variables
- **Strong** reasoning can infer many inconsistent pairs of values
- **Difficult** search for a supporting k-tuple

# **Modified Path-Consistency for SAT**

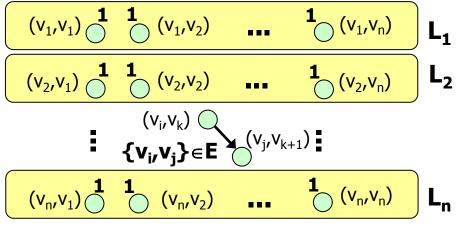

#### Deduce more information from constraints

- decompose values into disjoint sets (called layers ... L<sub>1</sub>, L<sub>2</sub>,..., L<sub>M</sub>)
- deduce more information from constraints calculate maximum size of the intersection of the constructed path with individual layers – denoted as χ
- Stronger restriction on paths > stronger propagation

## NP-completeness of the Modified Path Consistency

- Enforcing **modified path-consistency** is **difficult** (NP-complete)
  - The decision problem is whether there exists a path conforming to the maximum size of the intersection with individual layers.
- Lemma: The decision variant of the problem belongs to the NP class.
  - The path is of polynomial size with respect to the graph interpretation.
  - It can be checked in polynomial time whether the path conforms to the maximum size of intersection with individual layers.
- Lemma: The existence of a Hamiltonian path in a graph is reducible to the existence of a path conforming to the maximum size of intersection with layers.
- Main idea of the proof: G=(V,E), where V={v<sub>1</sub>,v<sub>2</sub>,...,v<sub>n</sub>}
  (i) Construct an instance of modified path consistency in the form of a matrix
- (ii) Associate rows of the matrix with layers and set the maximum size of the intersection to 1

9 | CSCLP 2011, York, United Kingdom

Pavel Surynek, 2011

## **Intersection Matrices**

- An **intersection matrix** is defined for each value in the graph interpretation of path-consistency it is denoted as  $\psi(v)$ 
  - Let L<sub>1</sub>, L<sub>2</sub>, ..., L<sub>M</sub> be a layer decomposition of the graph interpretation
  - Let K be the number of variables involved in the path
  - The intersection matrix is of type  $M \times (K+1)$
- Intersection matrix  $\psi(v)$  w.r.t. a pair of values  $v_0$  and  $v_K$ 
  - ψ(v)<sub>i,j</sub> represents the number of paths starting in v<sub>0</sub> and ending in v that partially conforms to maximum sizes of intersection with layers such that they intersect with L<sub>i</sub> j-times.
- It is not possible to enforce exact conformity to calculated maximum sizes of intersection with layers
  - Therefore we need to talk about partial conformity.

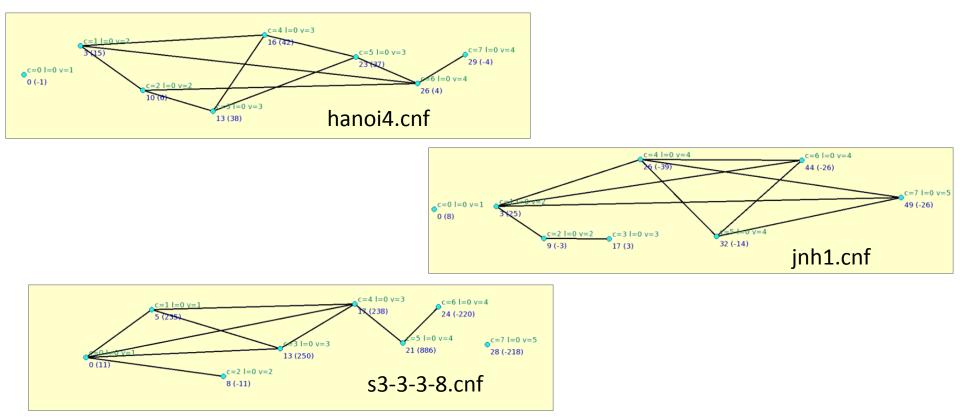

## **Intersection Matrix Calculation**

- Intersection matrix can be updated easily
  - ψ(v) is calculated from ψ(u<sub>1</sub>), ψ(u<sub>2</sub>),..., ψ(u<sub>m</sub>) where u<sub>1</sub>,
    u<sub>2</sub>,..., u<sub>m</sub> are a values from the domain of the **previous** variable in the path
- If it is detected that **no** of the paths starting in  $\mathbf{v}_0$  and ending in  $\mathbf{v}$  conforms to the maximum size of the intersection with the layer  $L_i$  such that  $v \in L_i$  then  $\psi(v)$  is set to 0 (matrix)
  - maximum intersection sizes with other layers cannot be violated since intersection size with them does no change
  - relaxation: paths that do not conform to maximum sizes of intersections with layers are propagated further

# **Visualization of Layers**

using GraphExplorer software (Surynek, 2007-2010)

- Layer decomposition was constructed with several most constrained clauses
  - several benchmark problems from the SAT Library

12 | CSCLP 2011, York, United Kingdom

# **Experimental Evaluation** (1)

- Modified path-consistency on **pigeon-hole** instances (decisions)
  - standard path-consistency is unable to infer any new clause

## **Conclusion and Future Work**

- The **modification** of path-consistency towards (2,k)-consistency has been studied
  - exploits more global inference than the standard version
  - non-neighboring variables in the path are taken into account
  - maximum intersection sizes with layers (subsets of values) is used as pruning condition
- Experimental evaluation shown some potential of the suggestion for future work
  - further increasing of inference strength towards
    (2,k)-consistency
  - keep low computational costs
